

Chemical Compatibility Escalation Procedure

Application Engineering procedure for uncertain chemical service

Document ID	HEL-AE-PR-17
Version	3.0
Status	Approved
Effective date	08 May 2026
Owner	Application Engineering
Access	Sales, Service, Engineering

When escalation is required

- Fluid composition or concentration is unknown.
- Customer operates within 5°C of a seal temperature limit.
- Customer requests a guarantee on chemical compatibility.
- Process contains solvents, oxidisers, acids, alkalis or mixed cleaning chemicals not listed in approved guidance.
- Previous service history indicates seal swelling, cracking or rapid degradation.

Minimum information required

Field	Required detail
Fluid / mixture	Commercial name and chemical composition if available
Concentration	Normal and maximum concentration
Temperature	Normal, maximum and cleaning / sterilisation temperature
Pressure	Normal and maximum system pressure
Duty cycle	Continuous, intermittent or batch
Existing materials	Pump and seal materials if replacing installed equipment

Customer communication rule

Do not state chemical compatibility as guaranteed until Application Engineering has confirmed the configuration.

Sales may communicate that a configuration appears technically suitable based on current documentation, but must label the recommendation as subject to final application review where escalation criteria apply.
