

Proposal PR-2025-041 - ACME Chemicals

Technical-commercial proposal for Specialty chemicals application

Proposal ID	PR-2025-041
Customer	ACME Chemicals
Country	Germany
Date	2025-11-18
Status	Closed / Historical
Owner	Helios Sales Engineering
Access	Sales, Service

1. Customer requirement

Requirement	Customer condition
Fluid	Chemically treated water
Operating temperature	88°C
System pressure	7 bar
Required flow	70 m³/h
Duty	Continuous

2. Proposed solution

HX-240 with FKM seal

Selected because duty fits the HX-240 hydraulic envelope; FKM was chosen to provide thermal margin above the standard EPDM recommendation.

Reference product limits considered during proposal preparation: 10 bar maximum pressure; 95°C continuous fluid temperature; 15-85 m³/h flow range.

3. Configuration notes

- Wetted material: 316L stainless-steel wetted parts.
- Seal arrangement: FKM seal.
- Final motor sizing to be confirmed against detailed duty point and site electrical standard.
- Installation design, pipe stress and NPSH validation remain customer / EPC responsibilities unless explicitly included.

4. Commercial assumptions

- Proposal is based on the stated process conditions only.
- Material and seal compatibility are subject to complete fluid information.
- Any change in temperature, pressure, fluid composition or duty cycle requires review.
- This historical proposal is provided as enterprise knowledge and is not a current quotation.

5. Sales-engineering note

This proposal may be used as precedent for similar applications, but the current approved product documentation and latest customer conditions must take precedence.
